### **HPSS User's Guide**

High Performance Storage System, version 7.5.2.0.0, 14 June 2018

HPSS User's Guide High Performance Storage System, version 7.5.2.0.0, 14 June 2018	

### **Table of Contents**

1. Overview	
1.1. User interfaces	
1.1.1. File Transfer Protocol (FTP)	
1.1.2. Parallel FTP (PFTP)	
1.1.3. HPSS Virtual File System (VFS) interface	
1.2. Storage concepts	
1.2.1. Class of Service (COS)	
1.2.2. Storage class	
1.2.3. Storage hierarchy	
1.2.4. File family	
1.3. Interface usage considerations	
1.3.1. Possible reasons for using FTP	
1.3.2. Possible reasons for using PFTP	
1.4. User IDs	
1.5. User accounts	
2. File Transfer Protocol (FTP)	
2.1. FTP site (and quote) commands	
2.1.1. Allocating space for files - quote allo64	
2.1.2. Changing a file's group by ID - chgid	
2.1.3. Changing a file's group by name - chgrp	
2.1.4. Changing a file's permissions - chmod	
2.1.5. Changing a file's owner by name - chown	
2.1.6. Changing a file's owner by ID - chuid	
2.1.7. Getting the file family of a file - getfam	
2.1.8. Listing or setting idle time	
2.1.9. File listings for files newer than a specified date	
2.1.10. Staging a batch of files recursively - rstagebatch	
2.1.11. Specifying a file's Class of Service - setcos	
2.1.12. Specifying a file stars	
2.1.13. Staging a file - stage	12
2.1.15. Creating a symbolic link - symlink	
2.1.16. Setting the desire wait options (for migrated files) - wait	
2.2. List directory extensions	
3. Parallel File Transfer Protocol (PFTP)	
3.1. Parallel FTP client transfers	
3.1.1. Parallel FTP client/server configuration	
3.1.1.1. HPSS.conf file	
3.1.1.2. Local file functions	
3.2. PFTP <b>site</b> (and <b>quote</b> ) commands	
3.2.1. Listing or setting HPSS ACLs	
3.2.2. Determining or setting buffer sizes [GridFTP]	
3.2.3. Reading configuration options for the PFTP Server	
3.2.4. File listings for files newer than a specified date	
3.2.5. Perform media timing (eliminating the network transfer time)	
5.2.5. I errorm media timing (climinating the network transfer time)	23

#### HPSS User's Guide

3.3. Additional PFTP commands	. 23
3.3.1. General login messages (examples)	. 24
3.3.2. Parallel append - pappend	. 25
3.3.3. Parallel file store - pput	
3.3.4. Multiple parallel file store - mpput	. 27
3.3.5. Parallel file retrieval - pget	. 28
3.3.6. Multiple parallel file retrieval - mpget	. 29
3.3.7. Local file append - Ifappend	. 30
3.3.8. Local file store - lfput	
3.3.9. Local file retrieval - lfget	. 32
3.3.10. Multiple local file store - mlfput	. 34
3.3.11. Multiple local file retrieval - mlfget	35
3.3.12. Recursive commands - recursive	. 36
3.3.13. Specify transfer stripe width - setpwidth	37
3.3.14. Specify transfer block size - setpblocksize	38
3.3.15. Multinode enable or disable - multinode	
3.3.16. Autoparallel enable or disable - autoparallel	39
3.3.17. Get current protocol mode - getprot	40
3.3.18. Get tuning parameters - gettun	. 40
3.3.19. Set the PDATA_ONLY protocol - pdata	. 42
3.3.20. Set the PDATA_PUSH protocol - pdatapush	42
3.3.21. Set the PDATA_AND_MOVER protocol - pmover	. 43
3.3.22. Set the socket buffer size - setsock	. 43
3.3.23. Set the transfer buffer size - setxfer	. 44
A. Glossary of terms and acronyms	. 46
B. References	. 56
C. Developer acknowledgments	. 57

### **List of Figures**

3.1.	Local File Transfer Probable Configuration for Parallel FTP	19
3.2.	Local file transfer optimal configuration for Parallel FTP	20
3.3.	Local file transfer invalid configuration for Parallel FTP	21

### **List of Tables**

2.1.	havior of stage and wait commands	4
3.1.	TP client command-line options	1

**About this book.** The High Performance Storage System (HPSS) User's Guide provides the necessary information for transferring files using HPSS. In particular, the following interfaces are described:

- File Transfer Protocol (FTP)
- Parallel FTP (PFTP)
- HPSS Virtual File System (VFS)

**Note:** It is not the intent of this document to define the standard commands and subcommands provided by standard FTP and POSIX compliant file systems. Only interface extensions provided by HPSS are defined within the HPSS User's Guide.

Refer to the *HPSS Installation Guide* and the *HPSS Management Guide* for descriptions of the interfaces provided to HPSS administrators. Refer to the *HPSS Programmer's Reference* for programming interfaces provided to the end user. Refer to the *HPSS Error Messages Manual* for a list of all HPSS error and advisory messages which are output by the HPSS software.

The HPSS User's Guide is structured as follows:

- Chapter 1: Overview Provides an overview of each type of user interface, a summary of key storage concepts, and recommendations on usage.
- Chapter 2: File Transfer Protocol (FTP) Defines the extensions to the standard FTP interface.
- Chapter 3: Parallel File Transfer Protocol (PFTP) Defines the Parallel FTP (PFTP) interface.
- Appendix A: Glossary of Terms and Acronyms
- Appendix B: References Lists documents cited in the text as well as other reference materials.
- Appendix C: Developer Acknowledgments

**Typographic and keying conventions.** This document uses the following typographic conventions:

Example commands that should be typed at a command line will be proceeded by a percent sign ("%") and be presented in a boldface courier font:

#### % sample command

Any text preceded by a pound sign ("#") should be considered comment lines:

#### # This is a comment

Italic Italic words or characters represent variable values to be supplied.

- Brackets enclose optional items in syntax and format descriptions.
- Braces enclose a list of items to select in syntax and format descriptions.

### **Chapter 1. Overview**

The High Performance Storage System (HPSS) has been designed to meet the high end of archival storage system and data management requirements. These requirements have led to a scalable design which uses network attached storage devices to transfer data at rates up to multiple gigabytes per second into data stores of many petabytes.

Listed below are the user interfaces available for accessing data in the HPSS.

### 1.1. User interfaces

### 1.1.1. File Transfer Protocol (FTP)

HPSS provides an industry-standard FTP user interface. Because FTP is a serial interface, data sent to a user is received serially. This does not mean that the data within HPSS is not stored and retrieved in parallel. It simply means that the FTP daemon within HPSS must consolidate its internal parallel transfers into a serial data transfer to the user. HPSS FTP performance in many cases will be limited not by the speed of a single storage device, as in most other storage systems, but by the speed of the data path between the HPSS FTP daemon and the user's FTP client.

All FTP commands are supported or properly rejected if the HPSS Parallel FTP Daemon does not implement a specific feature. In addition, the ability to specify Class of Service is provided via the **quote site** or **site** commands. Additional **site** command options are provided for **chgrp**, **chgid**, **chmod**, **chown**, **chuid**. **stage**, **wait**, and **symlink**. The HPSS PFTP Daemon supports access from any FTP client that conforms to RFC-0959. In addition, the **quote allo64** command is supported. Additional "site" commands are available as described in Section 2.1, "FTP **site** (and **quote**) commands" below.

Proxy (third-party) transfers are not supported. Also, to maximize performance, the user should explicitly change the data transfer type to binary. ASCII transfers are very inefficient as the daemon must scan the entire file to determine how many carriage returns to insert so that it can compute the actual amount of date to transfer. It may also cause incorrect results if a file is stored as binary and retrieved as ASCII, or vice versa.

Refer to the HPSS Installation Guide for information on configuring PFTP.

### 1.1.2. Parallel FTP (PFTP)

PFTP supports normal FTP plus extensions. It is built to optimize FTP performance for storing and retrieving files from HPSS by allowing the data to be transferred in parallel to the client. The interface presented to the user has syntax similar to FTP but with some extensions to allow the user to transfer data to and from HPSS across parallel communication interfaces. PFTP supports transfers via TCP/IP and communicates directly with HPSS Movers to transfer data.

The following constraints are imposed by PFTP.

• Outbound "Pipes" may be configured and supported. Inbound "Pipes" (pgets) are NOT supported. The use of "Pipes" should be discouraged.

- Proxy (third-party) transfers are not supported.
- ASCII transfers are not supported over the parallel interface. Since extra characters are inserted in the stream by the ASCII translation, there is no way to resolve data placement in a parallel stream. Note that some standard FTP implementations default to ASCII or to "Auto". If either of these are the case, it will be necessary to specify binary by entering the *bin* command.
- PFTP client access is supported only from nodes which support the HPSS PFTP client software.

### 1.1.3. HPSS Virtual File System (VFS) interface

Support for HPSS VFS has been deprecated in favor of an analogous application called HPSSFS-FUSE. Refer to HPSSFS-FUSE documentation for its usage.

### 1.2. Storage concepts

This section defines key HPSS storage concepts which have a significant impact on the usability of HPSS. Configuration of the HPSS storage objects and policies is the responsibility of your HPSS administrator.

### 1.2.1. Class of Service (COS)

A COS is an abstraction of storage system characteristics that allows HPSS users to select a particular type of service based on performance, space, and functionality requirements. Each COS describes a desired service in terms of characteristics such as minimum and maximum file size, transfer rate, access frequency, latency, and valid read or write operations. The desired COS is selected when the file is created. Underlying a COS is a storage hierarchy that describes a progression of storage media that may be used to store the file.

For the FTP and PFTP interfaces, the COS ID may be explicitly specified by using the **site setcos** command. If not specified, a default COS is used. Contact your HPSS administrator to determine the COSs which have been defined and available for your use.

PFTP provides a feature to automatically store the local file size in the minimum and maximum file size fields of the COS. This feature is also provided for FTP clients which support the **ALLO** command. This allows the COS selection to be made according to file size. The HPSS administrator should ensure that COS definitions contain proper minimum and maximum file sizes in order for PFTP (FTP clients which support **ALLO**) to optimize storage utilization when transferring files to HPSS. Note: If the COS ID is explicitly set by using the **site setcos** command, that COS will be used regardless of file size.

A COS is implemented by a storage hierarchy of one to five storage classes. Storage hierarchies and storage classes are not directly visible to the user, but are described in the following sections.

### 1.2.2. Storage class

An HPSS storage class is used to group various storage media together to provide them with uniform characteristics. The attributes associated with a storage class are both physical and logical. Physical storage media in HPSS are called physical volumes. Physical characteristics associated with physical

volumes are the media type, block size, the estimated amount of storage space on volumes in this class, and how often to write tape marks on tape volumes.

Physical volumes are organized into logical virtual volumes. Virtual volumes can be striped by aggregating two or more physical volumes in the virtual volume. Some of the virtual volume attributes associated with the storage class are virtual volume block size, stripe width, data transfer rate, latency associated with devices supporting the physical media in this class, and disk storage segment size. In addition, the storage class has attributes that associate it with a particular migration policy and purge policy to help in managing the usage of media in the storage class.

RAIT volume characteristics are described in storage classes. When a tape storage class is defined to have three or more physical volumes in a stripe, and a nonzero value for the ParityStripeWidth, then that storage class defines RAIT volumes. Virtual volumes created in such a storage class will have RAIT characteristics.

### 1.2.3. Storage hierarchy

An HPSS storage hierarchy consists of one to five storage classes in a fixed order. Files are moved up and down the storage hierarchy via stage and migrate operations, based upon storage policy, usage patterns, storage availability, and user request. For example, a storage hierarchy might consist of a fast disk storage class, followed by a fast data transfer and medium storage capacity robot tape system storage class, which in turn is followed by a large data storage capacity, but relatively slow data transfer tape robot system storage class. Files are placed on a particular level in the hierarchy depending on the migration policy and staging operations. Multiple copies of a file may also be specified in the migration policy. If data is duplicated for a file at multiple levels in the hierarchy, the more recent data is at the higher level (lowest level number) in the hierarchy. Typically, files are first recorded at the top level of the storage hierarchy, then migrate to lower levels over time, following the rules laid down in the migration policy associated with the storage hierarchy. The purge policy determines when a file migrated to a lower level is purged from an upper level. When the file is read, it is usually first staged back to a higher level following the rules of the migration policy.

### 1.2.4. File family

A file family is an attribute of an HPSS file that is used to group files on tape virtual volumes. When a file is migrated from disk to tape, it is migrated to a tape virtual volume assigned to the family associated with the file. If no tape is associated with the family, the file is migrated to the next available tape not associated with a family, then that tape is assigned to the family. The family affiliation is preserved when tapes are repacked. Configuring file families is an HPSS administrator function.

### 1.3. Interface usage considerations

Guidance on when to use a particular HPSS interface is provided below. In general, PFTP provides the best data transfer performance.

### 1.3.1. Possible reasons for using FTP

• Utilizes standard FTP interface - Users and applications familiar with FTP can access HPSS with the standard command set.

 Supports standard FTP client on most platforms - FTP commands may be issued from any vendor nodes with an FTP interface. NOTE: Some GUI-based FTP clients may NOT function properly. No specialized code is required.

### 1.3.2. Possible reasons for using PFTP

- Provides faster file transfers than FTP PFTP is a better performer than FTP (for large files) since it provides the capability to stripe data across multiple client data ports.
- Supports files greater than 2 GB PFTP supports file sizes up to  $2^{64}$  bytes.
- Supports partial file transfer PFTP provides options on the **pget** and **pput** commands to perform partial file transfers. This is beneficial to users who want to extract pieces of large files.

### 1.4. User IDs

After the HPSS system is configured, the necessary accounts must be created for HPSS users. Contact your HPSS administrator to add an account.

For FTP/PFTP access, an FTP account must be created. Contact your HPSS administrator to set up your account.

Users calling the utilities described in this document may need to be properly logged in with valid credentials. If the site is using Kerberos authentication, this will require the user to issue the **kinit** function call to acquire credentials. If UNIX authentication is being used, some of the utilities will require the user to provide the user password in order to use the utility. The **hpssuser** utility with proper parameters should be used by the HPSS administrator to create the Kerberos or UNIX accounts.

### 1.5. User accounts

As mentioned in the previous section, the user utilities may require the user to have obtained valid Kerberos or UNIX credentials. The HPSS administrator should use the **hpssuser** utility to create the proper user accounts.

In order to create the credentials, the proper command must be issued. For example, if you are using Kerberos authentication, the following should be issued:

% kinit <principal name>

When this command is entered, the principal's identity is validated, and the network credentials are obtained. The user will be prompted for the password.

If UNIX authentication is being used, the **HPSS** utility will prompt for the user password. An example of this is running the **scrub** utility.

If using Kerberos authentication and the login context is no longer required, the following command may be used to destroy the login context and associated credentials:

% kdestroy

Another co	ommand which	might be	of interest to	the user is:

• klist - list the primary principal and tickets held in the Kerberos credentials cache.

### Chapter 2. File Transfer Protocol (FTP)

This chapter describes the HPSS FTP interface. FTP is supported from any FTP client platform.

HPSS supports the FTP command set for transferring files to and from HPSS through the use of the following syntax:

```
ftp <host> [<port_number>]
```

where,

host is the name of the node where the HPSS PFTP Daemon process resides

port\_number is the port number for HPSS, as set up in /etc/services.

At this point, any standard FTP command may be entered. Note: If the message 451 Local resource failure: audit info. is received, contact your HPSS administrator. This message generally implies that either HPSS is not correctly configured, or some HPSS components may not be executing.

### 2.1. FTP site (and quote) commands

HPSS also supports the **site** commands listed below (for example, site setcos 300 or quote site setcos 300). *NOTE:* **site** commands supported only by the HPSS PFTP clients are listed and described in Chapter 3, Parallel File Transfer Protocol (PFTP).

Note: On some platforms, it may be necessary to specify **quote site** instead of **site**.

- allo64
- · chgid
- chgrp
- chmod
- **chown** (valid only for *root* account)
- **chuid** (valid only formatting *root* account)
- · getfam
- idle
- newer
- rstagebatch
- setcos
- setfam

- stage
- stagebatch
- symlink
- wait
- umask

A detailed explanation of each command follows.

### 2.1.1. Allocating space for files - quote allo64

This command is used to specify the size of a file for space allocation.

```
quote allo64 <size>
```

where,

size is a string representing the size of the file. The size may be a decimal number less than  $2^{64}$  or may be in the form of a decimal number followed by a magnitude representation string. No spaces are allowed between the decimal number and the magnitude representation string. Accepted magnitude representation strings are:

```
KB (kilobyte = 1024),

MB (megabyte = 1,048,576),

GB (gigabyte = 1,073,741,824),

TB (terabyte = 1,099,511,627,776),
```

PB (petabyte = 1,125,899,906,842,624).

The magnitude representation string is case-independent. The decimal component may contain up to two decimal points of precision.

"1005.03" will truncate to "1005" if no magnitude representation string is specified. Similar truncations will occur for excess precision specifications.

This command provides a 64-bit extension to the standard **quote allo** *size* command. NOTE: the **quote allo** *size* command only accepts decimal values for size. Both these commands are helpful for providing hints for non-parallel "put" commands.

Example: The following may be entered to specify the file size of 8 GB.

ftp> quote allo64 8GB

### 2.1.2. Changing a file's group by ID - chgid

This command is used to change the group ID of a file and has the following format:

```
quote site chgid <gid> <file>
```

where,

gid is the new group ID of the file

*file* is the name of the file.

The user must belong to the specified group and be the owner of the file, or be the *root* user.

Example: The following may be entered to change the group ID of myfile to group ID "210".

ftp> quote site chgid 210 myfile

### 2.1.3. Changing a file's group by name - chgrp

This command is used to change the group name of a file and has the following format:

```
quote site chgrp <group> <file>
```

where.

group is the new group name of the file

file is the name of the file.

The user must belong to the specified group and be the owner of the file, or be the *root* user.

Example: The following may be entered to change the group of myfile to group "mygroup".

ftp> quote site chgrp mygroup myfile

### 2.1.4. Changing a file's permissions - chmod

This command is used to change the mode of a file and has the following format:

```
quote site chmod <mode> <file>
```

where.

mode is the new octal mode number of the file

file is the name of the file.

Mode is constructed from the bitwise OR of the following modes:

0400 read by owner

0200 write by owner

0100 execute (search in a directory) by owner

0040 read by group

0020 write by group

0010 execute (search in a directory) by group

0004 read by others

0002 write by others

0001 execute (search in a directory) by others

Note: The following mode values are ONLY supported by issuing the command using the symbolic formats:

4000 set user ID on execution (u+s)

2000 set group ID on execution (g+s)

1000 sticky bit (o+t)

NOTE: The setuid bit and sticky bits have no meaning in HPSS; but may be set and unset. The setgid bit is ON by default (although it is NOT printed by default) and sets "inheritance" when on.

Only the owner of the file or *root* user can change its mode.

Example: The following may be entered to change the mode of *myfile* to "read", "write by owner", and "group".

```
ftp> quote site chmod 0660 myfile
```

Example: The following may be entered to change the mode of *myfile* to "read", "write by owner", and "group", and also to set the gidbit. All other mode bits are left unchanged.

ftp> quote site chmod u+rw,g+rws myfile

### 2.1.5. Changing a file's owner by name - chown

This command is used to change the owner of a file and has the following format:

```
quote site chown <owner> <file>
```

where,

owner is the new owner of the file

file is the name of the file.

Only the *root* user can change the owner of a file.

Example: The following may be entered to change the owner of /home/smith/myfile to "jones".

ftp> quote site chown jones /home/smith/myfile

### 2.1.6. Changing a file's owner by ID - chuid

This command is used to change the UID of a file and has the following format:

```
quote site chuid <uid> <file>
```

where,

uid is the new UID of the owner of the file

file is the name of the file.

Only the *root* user can change the UID of a file.

Example: The following may be entered to change the UID of /home/smith/myfile to "201".

ftp> quote site chuid 201 /home/smith/myfile

### 2.1.7. Getting the file family of a file - getfam

This command is used to get the file family of a file:

```
quote site getfam [filename]
```

where,

filename is the name of the file for which the file family is desired.

Example: The following will display the file family of myfile

```
ftp> quote site getfam myfile
200 myfile file family set to 8
```

If no *filename* is specified, the command returns the current file family setting. Example:

```
ftp> quote site getfam
200 Current file family is 8.
```

### 2.1.8. Listing or setting idle time

This command is used to determine or change the default idle time (in seconds):

```
quote idle time
```

where,

time is a number in seconds less than the maximum idle time.

Example: The following may be entered to set the idle time to 1000 seconds.

```
ftp> quote site idle 1000
200 Maximum IDLE time set to 1000 seconds
```

Without a size specifier, the current idle time is returned:

```
ftp> quote site idle
200 Current IDLE time limit is 1000 seconds; max 7200
```

# 2.1.9. File listings for files newer than a specified date

The **newer** command is used to determine which files in a directory are newer than a specified date. It provides a recursive short listing of files newer than the specified date.

quote site newer date path

where,

date refers to the date in the format YYYYMMDDHHMMSS

path refers to the pathname.

Example: The following may be entered to determine the files newer than March 03, 2005 13:51:22 in the path specified by *mypath*.

```
ftp> quote site newer 20050301135122 mypath
mypath/scrub_tests/file87
mypath/scrub_tests/file88
mypath/scrub_tests/file89
```

# 2.1.10. Staging a batch of files recursively - rstagebatch

This command is used to initiate a stage of a batch of migrated files (for example, from tape to disk). The user can initiate the **rstagebatch** and then return at a later time to initiate the file transfer using the FTP **mget** or PFTP **mpget** commands.

Note: This operation is recursive and will recursively stage all files in directories that match the glob pattern. For a nonrecursive batch stage, use **stagebatch**.

```
quote site stagebatch <glob>
```

where.

files is a glob to match the files to be staged.

Example: The following may be entered to stage files that match /home/smith/f\*.

ftp> quote site stage /home/smith/f\*

### 2.1.11. Specifying a file's Class of Service - setcos

This command is used to specify a class of service and has the following format:

```
quote site setcos <cos_id>
```

where,

cos\_id is the Class of Service identifier (used when creating a new HPSS file during a **put** operation).

Class of Service is used as a means for specifying the amount of parallelism or media stripe width for a file. See your HPSS administrator for the Class of Service identifiers defined for your site. If a Class of Service is not specified, a default is used. *NOTE: Parallel and Striped transfers are NOT supported by the non-Parallel FTP Clients*.

In the example below, the following commands might be entered to **put** a large file to HPSS with a Class of Service identifier of "4".

ftp> quote site setcos 4

### 2.1.12. Specifying a file's file family - setfam

This command is used to specify a file family and has the following format:

```
quote site setfam [fam_id]
```

where,

fam\_id is the file family identifier (used when creating a new HPSS file during a **put** operation).

Example: the following command might be entered to **put** a large file to HPSS with a file family of "8".

```
ftp> quote site setfam 8
200 Family set to 8.
```

If no fam\_id is specified, the command returns the current file family setting. Example:

```
ftp> quote site setfam
200 Current file family is 8.
```

In order to clear the current file family, call this command with fam\_id set to "0". Example:

```
ftp> quote site setfam 0
200 File family is now cleared
```

### 2.1.13. Staging a file - stage

This command is used to initiate a stage of a migrated file (for example, from tape to disk). The user can initiate the **stage** and then return at a later time to initiate the file transfer using the FTP **get** or PFTP **pget** commands.

```
quote site stage <file>
```

where,

file is the name of the file.

Example: The following may be entered to stage file /home/smith/myfile.

```
ftp> quote site stage /home/smith/myfile
```

### 2.1.14. Staging a batch of files - stagebatch

This command is used to initiate a stage of a batch of migrated files (for example, from tape to disk). The user can initiate the **stagebatch** and then return at a later time to initiate the file transfer using the FTP **mget** or PFTP **mpget** commands.

Note: This operation is not recursive and will only stage the files in the top level. For a recursive batch stage, use **rstagebatch**.

```
quote site stagebatch <files>
```

where,

files is a glob to match the files to be staged.

Example: The following may be entered to stage files that match /home/smith/f\*.

ftp> quote site stage /home/smith/f\*

### 2.1.15. Creating a symbolic link - symlink

This command is used to create a symbolic link.

quote site symlink <path/file> <link>

where,

path/file refers to the destination

link refers to the local filename.

Example: The following may be entered to create a link named sys\_passwd in the local directory pointing to /etc/passwd.

ftp> quote site symlink /etc/passwd sys\_passwd

A dir command will show sys\_passwd -> /etc/passwd.

# 2.1.16. Setting the desire wait options (for migrated files) - wait

This command is used to notify the HPSS PFTP Daemon.

quote site wait <option>

where,

option is one of the following values:

- -1 or inf(inite) wait forever for the file to be staged. Do not return from the **get** or **pget** command to complete until the file has been transferred or a transfer error has occurred.
- 0 do not wait for the file to be staged. If the file has been migrated, return the appropriate message and initiate the stage. The user will return later to reissue the **get** or **pget** command.

n (where n is an integer) - wait the specified period (in seconds) for the file requested by a **get** or **pget** command to complete. Either transfer the file if the file is staged within the specified period or return a reply to notify the user to try again later.

Example: The following may be entered to wait for files to be staged.

```
ftp> quote site wait -1
```

The following table describes the behavior the customer should expect from FTP when issuing the **stage** and **wait** commands. Only Classes of Service utilizing the "Stage on Open Background" option

will exhibit predictable results. Refer to the *Class of Service* section in the *HPSS Installation Guide* for more information.

Table 2.1. Behavior of stage and wait commands

Wait Time	File Condition	Command	Behavior/Message
No Wait	Archived	quote site stage xyz	"File xyz is being retrieved from archive."
No Wait	Not Archived	quote site stage xyz	"File xyz is currently ready for other processing."
Wait #	Archived	quote site stage xyz	Wait for period then receive message: "File xyz is currently ready for other processing." or "File xyz is currently ready for other processing." if the file is staged in the time frame allowed.
Wait #	Not Archived	quote site stage xyz	"File xyz is currently ready for other processing."
No Wait	Archived	get xyz	"File xyz is being retrieved from archive."
No Wait	Not Archived	get xyz	Transfers data as expected.
Wait #	Archived	get xyz	Wait for period then receive message: "File xyz is being retrieved from archive." or transfers data as expected if file is staged in the time allowed.
Wait #	Not Archived	get xyz	Transfers file as expected.

### 2.1.17. Changing the default umask

The **umask** command is used to change the default umask.

quote site umask octal-mask

where,

octal-mask refers to the octal mask to be applied.

Example: The following may be entered to change the default umask to "2".

ftp> quote site umask 0002

When issued without an octal value, the active umask is displayed.

### 2.2. List directory extensions

FTP supports the **ls** command to list the contents of a directory. Standard options supported are: **ls**, **ls** -**l**, **ls** -**a**, and **ls** -**F**. In addition to the standard **ls** options generally provided, HPSS also provides a -**lh** 

option. If **- lh** is specified, then a long directory listing is generated. However, in place of the owner field (field #3) and group field (field #4) listed for the **-l** option, the Class of Service identifier and Account Code are listed.

#### **Example:**

f+n> la lh			
ftp> ls -lh			
-rw-rw 1 1	198	157286400 May 13 1996	TEST
-rw-rr 1 1	160	32768 May 16 1996	prod1
-rw-rr 1 1	160	32768 May 16 1996	prod10
-rw-rr 1 1	160	32768 May 16 1996	prod11
-rw-rr 1 1	160	32768 May 16 1996	prod12
-rw-rr 1 1	160	32768 May 16 1996	prod13
-rw-rr 1 1	160	32768 May 16 1996	prod14
-rw-rr 1 1	160	32768 May 16 1996	prod15
-rw-rr 1 1	160	32768 May 16 1996	prod151
-rw-rr 1 1	160	32768 May 16 1996	prod152
-rw-rr 1 1	160	32768 May 16 1996	prod153
-rw-rr 1 1	160	32768 May 16 1996	prod154
-rw-rr 1 1	160	32768 May 16 1996	prod155
-rw-rr 1 1	160	32768 May 16 1996	prod156
-rw-rr 1 1	160	32768 May 16 1996	prod157
-rw-rr 1 1	160	32768 May 16 1996	prod158
-rw-rr 1 1	160	32768 May 16 1996	prod159

# **Chapter 3. Parallel File Transfer Protocol** (PFTP)

This chapter specifies the HPSS PFTP interface. In order to use PFTP, the PFTP client code must be compiled and supported on the client platform. Contact HPSS support for more guidance. PFTP supports the FTP command set plus some additional commands. Refer to *Section 3.3*, "Additional PFTP commands" for more information. To use PFTP, the user enters one of the following commands:

```
pftp_client [-bStringSize] [-c] [-d] [-e] [-g] [-h] [-i] [-m] [-n] [-p]
[-t] [-v] [-w###] [-Astring][-BStringSize] [-C###]
[-R#-#][-SsizeString][-T][-3][Host [Port]]
```

where,

Table 3.1. PFTP client command-line options

Option	Description	
-b	Sets the PDATA protocol Blocksize. StringSize is the size specification in the format: Digit(s)Magnitude; for example, "1MB".	
-c	Sets "Child" mode. This provides the ability to "emulate" a tty and interactive mode when executing the client in a "batch" mode.	
-d	The standard FTP debug specification.	
-е	Sets "Echo" mode. When running the client in "batch" mode, this causes the client to echo each command into the output file providing a helpful record of commands interleaved with the return messages.	
-g	Disables the expansion of metacharacters in file names. Interpreting metacharacters can be referred to as expanding (sometimes called globbing) a file name. See the <b>glob</b> subcommand.	
-h	Specifies use of the original HPSS protocol, PDATA_AND_MOVER, regardless of the default specified in the HPSS.conf file	
-i	Turns off interactive prompting during multiple file transfers. See the <b>prompt</b> , <b>mget</b> , <b>mput</b> , and <b>mdelete</b> subcommands for descriptions of prompting during multiple file transfers.	
-k	Kerberos ONLY option to specify an alternate Kerberos Realm for the PFTP Daemon.	
-m	This argument will enable multinode processing. By default, multinode processing is disabled. Multinode will be ignored if NO multinode specification for this client/daemon pair is specified in the HPSS.conf file.	
-n	Prevents an automatic login on the initial connection. Otherwise, the <b>ftp</b> command searches for a \$HOME/.netrc entry that describes the login and initialization process for the remote host. See the <b>user</b> subcommand.	

Option	Description	
-р	Specifies use of the HPSS protocol (PDATA_ONLY) for parallel transfers regardless of the default in the HPSS.conf file.	
-t	The standard FTP trace specification.	
-v	Displays all the responses from the remote server and provides data transfer statistics. This display mode is the default when the output of the <b>ftp</b> command is to a terminal, such as the console or a display.	
-W	This argument will set the pwidth. The pwidth value must be specified immediately following this argument.	
-A	Specify the user authentication mechanism.  Values: GSS, USER_PASS	
-В	Sets the Parallel Blocksize for parallel transfers. StringSize is the size specification in the format: Digit(s)Magnitude; for example, "1MB".	
-C	Sets the default Class of Service (COS) for the session. The argument is a valid string representation of a decimal COS. COS names are NOT accepted.	
-P	Specifies use of the PDATA_PUSH protocol. This will be overridden if another protocol is specified in the .netrc file or if an explicit specification of another protocol is made by the user.	
-R	Used to specify the valid ports for parallel transfers. This is useful in instances where network filters are invoked which provide port ranges for TCP traffic. The syntax is "start_range-end_range".	
-S	Sets the maximum open/close socket size for HPSS parallel transfers. An artificial maximum of 250 GB (subject to change) is compiled in. Results may be smaller than the specified value based on a number of external HPSS constraints. The default is 1.5 GB. StringSize is the size specification in the format: Digit(s)Magnitude; for example, "200GB".	
-T	Terminate session on error. Useful for batch processing.	
Host	The node where the HPSS PFTP Daemon process resides.	
Port	The port number for the HPSS PFTP Daemon, as set in /etc/ services.	

The local administrator may opt to define a **pftp** program link that points to **pftp\_client**.

The HPSS 7.5 **pftp\_client** provides both username/password authentication and the GSS facilities previously provided by the **krb5\_gss\_pftp\_client** binary in previous versions of HPSS. Contact HPSS support for details. These clients utilize either standard username/password authentication or the MIT Kerberos GSS facilities for authentication and reply processing. The GSS-based clients provide credential authentication facilities (password-less authentication) between the client and the HPSS Parallel FTP Daemon using Kerberos credentials for authentication.

The **pftp\_client** does NOT obtain the end user's initial Kerberos Credentials. The end user should obtain these credentials prior to initiating a **pftp\_client** session by doing the

appropriate Kerberos **kinit** command. MIT Kerberos is available from MIT and will NOT be supplied by the HPSS project for non-HPSS platforms.

Incompatibilities may exist between the HPSS (GSS) Parallel FTP Client and Daemon and the Kerberos-based FTP features provided by IBM with AIX 4.x and AIX 5.x. This has been reported in the past and was outside the jurisdiction of the HPSS project. The HPSS Parallel FTP Clients and Daemon are compatible with the MIT GSS-based FTP processes.

As a courtesy to HPSS customers, the Parallel FTP Client code is available for compilation at customer sites upon request on non-HPSS platforms, subject to any legal or licensing restrictions. This explicitly denies any support requirement on IBM or the HPSS development and support personnel for any modifications made by the customer. Contact HPSS support for details.

The HPSS PFTP Client has been successfully compiled on: Cray UNICOS [discontinued], Hewlett-Packard HP-UX [discontinued], Silicon Graphics IRIX [discontinued], Sun Solaris (Sparc and Intel), Intel Teraflop [discontinued], NEC [discontinued], IA64 Linux, Linux Intel (RHEL 4.0 and 5.0), SUSE 9.x for AMD64, Compaq Alpha [discontinued], and IBM AIX 5.3 and 6.1. All current ports may be compiled in either 32-bit or 64-bit mode.

Ports to other hardware or software components are the responsibility of the remote site. These sites will be asked to share their ports with the HPSS development team (and other HPSS facilities); however, neither IBM nor the HPSS development team accepts any obligation to incorporate any hardware or software ports into the distribution source. No site-specific features (local mods) added to the Parallel FTP client by customer sites will be incorporated into the PFTP client without the appropriate modification to the HPSS license agreement.

Note: If the message Local resource failure: audit info. is received, contact your HPSS administrator. This message generally implies that either HPSS is not correctly configured, or some HPSS components may not be executing.

### 3.1. Parallel FTP client transfers

Parallel transfers involve the creation of child processes to transfer the data between the source and the destination. This process may be either locally spawned PFTP client children, remotely initiated PFTP "children", or the combination of both. When the pwidth value is set and a valid multinode configuration file does not exist or multinode has not been activated, the PFTP client will provide parallel data paths to the Movers by spawning multiple processes on the same client node using one or more network interfaces (NICs).

Local File Transfer Probable Configuration for Parallel FTP

PFTP Client PFTPD Mover Machine Mover Process

Unix Filesystem /home /hpss\_home

Figure 3.1. Local File Transfer Probable Configuration for Parallel FTP

The multinode option supports spawning the client processes across multiple machines/nodes and multiple interfaces on the remote machines/nodes. This Multinode option may be beneficial on processors which support shared file systems, such as GPFS on the IBM SP. **NOTE: If multinode is used in a non-shared file system, the multinode file transfer to the client will be spread across multiple, separate files, which is not the desired behavior and can result in data integrity problems.** The client nodes which participate in a multinode transfer are selected from the HPSS.conf configuration file (see discussion below) which contains entries with control, and optionally, data interface names or addresses. The number of nodes selected from the configuration file is based on the pwidth value. The starting node is selected using an offset which is maintained by the PFTP client.

Tape(s) [ Migration ]

### 3.1.1. Parallel FTP client/server configuration

The PFTP client can read configuration information from the HPSS.conf file to provide optimal performance characteristics. This file is configurable by HPSS administrators to provide performance enhancement. Performance enhancements require considerable expertise. Contact HPSS support if you need these features. The PFTP server also reads this file and the file should be present in the directory /var/hpss/etc along with other HPSS configuration files. It should be marked as readable by everybody and writable only by *root*, for security reasons.

#### 3.1.1.1. HPSS.conf file

This configuration file is used to specify performance optimization parameters for the PFTP components, the HPSS Movers, and potentially site-specific applications. For details of the implementation of the HPSS.conf file, contact your HPSS administrator. This file is constantly being updated with additional features and enhancements.

#### 3.1.1.2. Local file functions

The local file functions represent performance enhancements using the HPSS parallel protocols where both the HPSS file and the UNIX source or destination file are "globally available" to the Movers and the PFTP client processes, such as GPFS file systems. The local file path must be specified in the file: /var/hpss/etc/hpss\_mvr\_localfilepath.conf. The specified path must exist for each PFTP Client/Mover machine.

Configuration Criteria:

Figure 3.2. Local file transfer optimal configuration for Parallel FTP

PFTP Client, PFTPD, Mover Machine

/hpss\_home

Tape(s) [ Migration ]

Local File Transfer Optimal Configuration for Farallel FTF

Figure 3.3. Local file transfer invalid configuration for Parallel FTP

Local File Transfer <u>Invalid</u> Configuration for Parallel FTP

### 3.2. PFTP site (and quote) commands

Several additional site commands are available with PFTP.

Note: On some platforms, it may be necessary to specify **quote site** instead of **site**.

- acl
- bufsize
- gettun
- minfo
- rdrmt
- wtrmt

These commands are described in the following subparagraphs.

### 3.2.1. Listing or setting HPSS ACLs

The acl command is used to list or set the ACLs for HPSS files and directories.

quote site acl command object

where,

command refers to an acl command from the following list:

- clear
- help
- remove
- replace
- show
- update

object refers to a file or directory.

Example: The following list the ACLs for a directory st\_data\_mgmt\_01.

```
ftp> quote site acl show st_data_mgmt_01
200 PORT command successful.
150 Opening ASCII mode data connection for acl list.
  user_obj:rwxcid
  group_obj:rwx-id
  other_obj:r-x---
226 Transfer complete.
56 bytes received in 0.0006 seconds (0.093 Mbytes/sec)
```

### 3.2.2. Determining or setting buffer sizes [GridFTP]

The **bufsize** command is used to determine or set the buffer size to be used for parallel transfers.

```
quote site bufsize size
```

where,

size refers to the desired buffer size.

Example: The following may be entered to set the buffer size to 1 MB.

```
ftp> quote site bufsize 1048576
200 Current TCP Buffer size is 1048576
```

Without a size specifier, the current buffer size is returned ("-1" means use the default).

# 3.2.3. Reading configuration options for the PFTP Server

The **quote gettun** command is used to determine characteristics that the Parallel FTP Server uses to transfer files to the Client. This is not implemented at this time.

```
quote gettun
```

Example: The following lists the default characteristics of the PFTP Server.

```
ftp> quote gettun
```

# 3.2.4. File listings for files newer than a specified date

The **minfo** command is used to determine which files in a directory are newer than a specified date. It provides a recursive long listing of files and directories in the specified path.

```
quote site minfo date path
```

where,

date refers to the date in the format YYYYMMDDHHMMSS

path refers to the pathname.

Example: The following may be entered to determine the files newer than March 03, 2005 13:51:22 in the path specified by mypath.

```
ftp> quote site minfo 20050301135122 mypath
F Mon Mar 21 16:43:16 2005 mypath/scrub_tests/file87
F Mon Mar 21 16:43:25 2005 mypath/scrub_tests/file88
F Mon Mar 21 16:43:33 2005 mypath/scrub_tests/file89
```

# 3.2.5. Perform media timing (eliminating the network transfer time)

The **quote rdrmt** command is used to time the reading of data from media by the Movers. Similarly, the **quote wtrmt** command is used to time the performance of writing data to the HPSS media. This is *not* implemented for HPSS PFTP Server.

```
quote rdrmt filename Media_read_size Quantity
quote wtrmt filename Media_write_size Quantity
```

NOTE: These functions are for obtaining performance information only and are not for use by users.

### 3.3. Additional PFTP commands

All FTP extensions described in Chapter 2 are supported by PFTP. In addition, the following commands (with their abbreviations, if any, shown in parentheses) are supported by PFTP:

- pappend (papp)
- pput, mpput (ppu, mpp)
- pget, mpget (pge, mpg)
- lfappend (lfa)
- lfput, mlfput (lfp, mlfp)
- lfget, mlfget (lfg, mlf)
- recursive (recu)

- setpwidth (setpw)
- setpblocksize (setpb)
- multimode (multi)
- autoparallel (autop)
- getprot (getp)
- gettuningparms (gettun)
- pdata
- pdatapush (pdatap)
- pmover (pmov)
- setsockbufsize (sets)
- setxferbufsize (setx)

Pipes are supported by the pput and pget commands if appropriate configuration is performed. The pipes facility uses temporary files. Configuration of the pipe temporary file path in the PFTP Client section of HPSS.conf is strongly advised.

### 3.3.1. General login messages (examples)

#### Without valid Kerberos Credentials:

```
my_prompt> pftp_client fire 4021
Parallel block size set to 1048576.
Connected to fire.clearlake.ibm.com.
220-#
    HPSS 7.5 Parallel FTP Daemon on fire
               coming from fire.clearlake.ibm.com
220 fire FTP server (HPSS 7.5 PFTPD V1.1.1 Mon Apr 4 06:36:09
CDT 2005) ready.
334 Using authentication type GSSAPI; ADAT must follow
GSSAPI accepted as authentication type
init_sec_context: (krb5) Miscellaneous failure: No credentials
cache found
init_sec_context: (krb5) Miscellaneous failure: No credentials
cache found
GSSAPI authentication failed
Name (fire:whrahe): hpss
331 GSSAPI user hpss is not authorized as hpss - Password
required.
Password: {abcdefgh}
230 User hpss logged in as hpss.
Remote system type is UNIX.
Using binary mode to transfer files.
**** NOTE: FTP Daemon supports feature discovery ****
**** NOTE: Server supports Parallel Features
```

```
**** Auto-Parallel Substitution Enabled. ****

**** NOTE: Protocol set to PDATA_AND_MOVER ****

**** NOTE: Daemon does NOT support Transfer Agent

Pwidth set to default(1).

Multinode is Disabled.

ftp>
```

#### With appropriate Kerberos Credentials (as HPSS):

```
my_prompt> pftp_client fire 4021
Parallel block size set to 1048576.
Connected to fire.clearlake.ibm.com.
    HPSS 7.5 Parallel FTP Daemon on fire
               coming from fire.clearlake.ibm.com
#
220 fire FTP server (HPSS 7.5 PFTPD V1.1.1 Mon Apr 4 06:36:09
CDT 2005) ready.
334 Using authentication type GSSAPI; ADAT must follow
GSSAPI accepted as authentication type
GSSAPI authentication succeeded
Preauthenticated FTP to fire as whrahe:
232 GSSAPI user hpss@FIRE.CLEARLAKE.IBM.COM is authorized as hpss
230 User hpss@FIRE.CLEARLAKE.IBM.COM logged in as hpss.
Remote system type is UNIX.
Using binary mode to transfer files.
**** NOTE: FTP Daemon supports feature discovery ****
**** NOTE: Server supports Parallel Features
          Auto-Parallel Substitution Enabled.
**** NOTE: Protocol set to PDATA AND MOVER ****
**** NOTE: Daemon does NOT support Transfer Agent
Pwidth set to default(1).
Multinode is Disabled.
```

### 3.3.2. Parallel append - pappend

#### **Synopsis**

pappend local\_file [remote\_file]

#### **Description**

The **pappend** command transfers a file from the local machine to HPSS. The transfer starts at the end of the remote file and continues until the entire file is moved or until an error occurs.

#### **Parameters**

local file. Identification of the file to transfer on the local machine.

*remote\_file*. Optional file name to the remote file. If not supplied, then the remote (HPSS) file name defaults to be the same as the local file name.

#### **Return strings**

Output shows the amount of data transferred and any error conditions.

#### **Error conditions**

Connection failures: data transfer connection malfunction.

Network failures: data transfer malfunction.

Allocation failures: no space on remote machine for file.

Error codes may also be returned from HPSS. The most common error codes are:

- "-5": an I/O error occurred.
- "-28": no space remaining in the associated storage class.

#### See also

RFC-0959.

#### **Examples**

- 1. Append local file testfile to the same file name in the user's HPSS home directory. ftp> pappend testfile
- 2. Append local file testfile to HPSS file prod1 in the current working directory. ftp> pappend testfile prod1

### 3.3.3. Parallel file store - pput

#### **Synopsis**

**pput** [-l local\_offset] [-r remote\_offset] [-s size] local\_file [remote\_file]

#### **Description**

The **pput** command transfers a file from the local machine to HPSS. If offsets and size of transfer are not specified, the transfer starts at the beginning of the local file and continues until the entire file is moved or until an error occurs. However, flexibility is provided to perform partial file transfers by specifying local file offset, remote file offset, and size of transfer. The *local\_offset*, *remote\_offset*, and *size* may be specified using a decimal and magnitude representation string.

The normal **pput** command functions just like the standard FTP **put** command and transfers an entire file.

#### **Parameters**

- -l local\_offset. Optional byte offset into the local file where the transfer is to begin.
- **-r** remote\_offset. Optional byte offset into the remote file where the data is to be placed.
- -s size. Optional byte size of the amount of data to transfer.

*local\_file*. Identification of the file to transfer on the local machine.

*remote\_file*. Optional file name to the remote (HPSS) file. If not supplied then the remote file name defaults to be the same as the local file name.

#### **Return strings**

Output shows amount of data transferred and any error conditions.

#### **Error conditions**

Connection failures: data transfer connection malfunction.

Network failures: data transfer malfunction.

Allocation failures: no space on remote machine for file.

Error codes may also be returned from HPSS. The most common error codes are:

- "-5": an I/O error occurred.
- "-28": no space remaining in the associated storage class.

#### See also

RFC-0959.

#### **Examples**

1. Transfer local file testfile to the user's HPSS home directory.

```
ftp> pput testfile
```

2. Transfer local file testfile to HPSS file prod1 in the current working directory.

```
ftp> pput testfile prod1
```

3. Transfer 1 MB from offset 1 MB of local file testfile to offset 0 of HPSS file /home/bob/prod1.

```
ftp> pput -l 1048576 -r 0 -s 1048576 testfile /home/bob/prod1
```

4. Transfer all local files which begin with "test" to the user's HPSS home directory using a pipe and **tar** (bundling).

```
ftp> pput " | tar cf - ./test*" my_test.tar
```

The pipe facility uses temporary files. It is strongly advised to configure a location for temporary files used by the pipe facility.

### 3.3.4. Multiple parallel file store - mpput

#### **Synopsis**

**mpput** local\_files

#### **Description**

The **mpput** command expands the files specified in the *local\_files* parameter at the local host and copies the indicated files to HPSS. The **mpput** command functions just like the standard FTP **mput** command.

#### **Parameters**

local\_files. Identification of the files to transfer on the local machine.

#### **Return strings**

Output shows the amount of data transferred and any error conditions.

#### **Error conditions**

Connection failures: data transfer connection malfunction.

Network failures: data transfer malfunction.

Allocation failures: no space on remote machine for file.

Error codes may also be returned from HPSS. The most common error codes are:

- "-5": an I/O error occurred.
- "-28": no space remaining in the associated storage class.

#### See also

RFC-0959.

#### **Examples**

1. Transfer all local files in the current directory to the user's HPSS home directory.

```
ftp> mpput *
```

2. Transfer all local files which begin with "test" in directory /usr/bob to the user's HPSS home directory.

```
ftp> lcd /usr/bob
ftp> mpput test*
```

### 3.3.5. Parallel file retrieval - pget

#### **Synopsis**

```
pget [-r remote_offset] [-l local_offset] [-s size] remote_file [local_file]
```

#### **Description**

The **pget** command transfers a file to the local machine from HPSS. If offsets and size of transfer are not specified, the transfer starts at the beginning of the remote file and continues until the entire file is moved or until an error occurs. However, flexibility is provided to perform partial file transfers by specifying remote file offset, local file offset, and size of transfer. The *local\_offset*, *remote\_offset*, and *size* may be specified using a decimal and magnitude representation string. See *Section 2.1.1*, "Allocating space for files - quote allo64" for use of this notation.

The standard **pget** command transfers entire files similar to the standard FTP **get** command.

#### **Parameters**

- **-r** remote\_offset. Optional byte offset where transfer is to begin in the remote file.
- -l local offset. Optional parameter where the data is transferred in the local file.
- -s size. Optional number of bytes to transfer.

remote\_file. Identification of the file to transfer from the remote (HPSS) host.

*local\_file*. Optional file name to the local file. If not supplied, then the local file name defaults to be the same as the remote file name.

#### **Return strings**

Output shows the amount of data transferred and any error conditions.

#### **Error conditions**

Connection failures: data transfer connection malfunction.

Network failures: data transfer malfunction.

Allocation failures: no space on local machine for file.

Error codes may also be returned from HPSS. The most common error code is:

• "-5": an I/O error occurred.

#### See also

RFC-0959.

#### **Examples**

1. Transfer HPSS file /home/bob/prod1 to the user's local directory. ftp> pget /home/bob/prod1

2. Transfer HPSS file prod1 in the current working directory to local file testfile1. ftp> pget prod1 testfile1

3. Transfer 1 MB from offset 0 of HPSS file /home/bob/prod1 to offset 1048576 of local file testfile.

```
ftp> pget -r 0 -l 1048576 -s 1048576 /home/bob/testfile1 testfile
```

4. Transfer and untar a tar file into the user's current working directory using a pipe and **tar** (unbundling).

```
ftp> pget my_test.tar " | tar xf -"
```

The pipe facility uses temporary files. It is strongly advised to configure a location for temporary files used by the pipe facility.

# 3.3.6. Multiple parallel file retrieval - mpget

#### **Synopsis**

mpget remote\_files

## **Description**

The **mpget** command expands the *remote\_files* parameter at the remote (HPSS) host and copies the indicated HPSS files to the current directory on the local host. The **mpget** command functions just like the standard FTP **mget** command.

#### **Parameters**

remote\_files. Identification of the files to transfer from the remote (HPSS) host.

# **Return strings**

Output shows the amount of data transferred and any error conditions.

## **Error conditions**

Connection failures: data transfer connection malfunction.

Network failures: data transfer malfunction.

Allocation failures: no space on remote machine for file.

Error codes may also be returned from HPSS. The most common error code is:

• "-5": an I/O error occurred.

#### See also

RFC-0959.

# **Examples**

1. Transfer all files in HPSS directory /home/bob to the user's local directory.

```
ftp> cd /home/bob
ftp> mpget *
```

2. Transfer all HPSS files which begin with "test" in directory /home/bob to the user's local directory.

```
ftp> cd /home/bob
ftp> mpget test*
```

# 3.3.7. Local file append - Ifappend

# **Synopsis**

**lfappend** *local\_file* [remote\_file]

# **Description**

The **Ifappend** is a performance-optimized Parallel FTP Client command used to append a "globally available" file into HPSS using the "parallel" protocols. *If* the input file is not available to the Mover machines (*not* "globally available"), the transfer will fail because the Movers will *not* be able to locate the desired file. The difference between **Ifappend** and **pappend** is that the Movers involved in the transfer will not use the network to move the data, thus providing improved performance. The Mover machines *must* be correctly configured. The file: /var/hpss/etc/hpss\_mvr\_localfilepath.conf *must* exist on each "local file"-aware Mover machine and *must* contain entries specifying which directories are eligible for "local file" transport.

The **lfappend** command transfers a file from the local machine to HPSS. The transfer starts at the end of the remote file and continues until the entire file is moved or until an error occurs.

#### **Parameters**

*local\_file*. Identification of the "globally available" file to transfer.

*remote\_file*. Optional file name to the remote file. If not supplied, then the remote (HPSS) file name defaults to be the same as the "globally available" file name.

# **Return strings**

Output shows the amount of data transferred and any error conditions.

#### **Error conditions**

Connection failures: data transfer connection malfunction.

Network failures: data transfer malfunction.

Allocation failures: no space on remote machine for file.

Error codes may also be returned from HPSS. The most common error codes are:

- "-5": an I/O error occurred.
- "-28": no space remaining in the associated storage class.

#### See also

RFC-0959.

# **Examples**

1. Append "globally available" file testfile to the same file name in the user's HPSS home directory.

```
ftp> lfappend testfile
...information is returned by the PFTP Daemon
ftp>
```

2. Append "globally available" file testfile to HPSS file prod1 in the current working directory.

```
ftp> lfappend testfile prod1
...information is returned by the PFTP Daemon
ftp>
```

# 3.3.8. Local file store - Ifput

# **Synopsis:**

**lfput** [-**l** local\_offset] [-**r** remote\_offset] [-**s** size] local\_file [remote\_file]

## **Description**

The **Ifput** is a performance optimized Parallel FTP Client command used to transfer a "globally available" file into HPSS using the "parallel" protocols. *If* the file is not available to the Mover machines (*not* "globally available"), the transfer will fail because the Movers will *not* be able to locate the desired file. The difference between **Ifput** and **pput** is that the Movers involved in the transfer will not use the network to move the data, thus providing improved performance. The Mover machines *must* be correctly configured. The file /var/hpss/etc/hpss\_mvr\_localfilepath.conf *must* exist on each "local file"-aware Mover machine and *must* contain entries specifying which directories are eligible for "local file" transport.

If offsets and size of transfer are not specified, the transfer starts at the beginning of the local file and continues until the entire file is moved or until an error occurs. However, flexibility is provided to perform partial file transfers by specifying local file offset, remote file offset, and size of transfer. The *local\_offset*, *remote\_offset*, and *size* may be specified using a decimal and magnitude representation string. See *Section 2.1.1*, "Allocating space for files - quote allo64" for use of this notation. The normal **lfput** command functions just like the standard FTP **put** command and transfers an entire file.

#### **Parameters**

- -l local\_offset. Optional byte offset into the "globally available" file where the transfer is to begin.
- **-r** remote\_offset. Optional byte offset into the remote file where the data is to be placed.
- -s size. Optional byte size of the amount of data to transfer.

*local\_file*. Identification of the "globally available" file to transfer. (This *must* be available to Mover machines.)

*remote\_file*. Optional file name to the remote (HPSS) file. If not supplied then the remote file name defaults to be the same as the "globally available" file name.

## **Return strings**

Output shows amount of data transferred and any error conditions.

#### **Error conditions**

Connection failures: data transfer connection malfunction.

Network failures: data transfer malfunction.

Allocation failures: no space on remote machine for file.

Error codes may also be returned from HPSS. The most common error codes are:

- "-5": an I/O error occurred.
- "-28": no space remaining in the associated storage class.

#### See also

RFC-0959.

# **Examples**

1. Transfer local file testfile in the current working directory of the client to the user's HPSS home directory.

```
ftp> cd ~
... information is returned by the PFTP Daemon
ftp> lfput testfile
... information is returned by the PFTP Daemon
ftp>
```

2. Transfer local file testfile in the current working directory of the client to HPSS file prod1 in the current working directory.

```
ftp> lfput testfile prod1
...information is returned by the PFTP Daemon
ftp>
```

3. Transfer 1 MB from offset 1 MB of local file testfile in the current working directory of the client to offset 0 of HPSS file /home/bob/prod1 with a new name testfile2.

```
ftp> lfput -1 1048576 -r 0 -s 1048576 testfile
/home/bob/prod1/testfile2
...information is returned by the PFTP Daemon
ftp>
```

# 3.3.9. Local file retrieval - Ifget

#### **Synopsis**

**lfget** [-**r** remote\_offset] [-**l** local\_offset] [-**s** size] remote\_file [local\_file]

#### **Description**

The **Ifget** is a performance optimized Parallel FTP Client command used to transfer an HPSS file into a "globally available" file using the "parallel" protocols. *If* the current working directory *or the specified directory* is not available to the Mover machines (*not* "globally available"), the transfer will fail because the Movers will *not* be able to locate the desired file. The difference between **Ifget** and **pget** is that the Movers involved in the transfer will not use the network to move the data, thus providing improved performance. The Mover machines *must* be correctly configured. The file: /var/hpss/etc/hpss\_mvr\_localfilepath.conf *must* exist on each "local file"-aware Mover machine and *must* contain entries specifying which directories are eligible for "local file" transport.

The **lfget** command transfers a file from HPSS to a "globally available" directory on the Mover machines. If offsets and size of transfer are not specified, the transfer starts at the beginning of the remote file and continues until the entire file is moved or until an error occurs. However, flexibility is provided to perform partial file transfers by specifying remote file offset, local file offset, and size of transfer. The *local\_offset*, *remote\_offset*, and *size* may be specified using a decimal and magnitude representation string. See *Section 3.3.10*, "Multiple local file store - mlfput" for use of this notation.

The standard **lfget** command transfers entire files similar to the standard FTP **get** command.

#### **Parameters**

- **-r** remote\_offset. Optional byte offset where transfer is to begin in the remote file.
- -l local\_offset. Optional parameter where the data is transferred in the local file.
- -s size. Optional number of bytes to transfer.

remote\_file. Identification of the file to transfer from the remote (HPSS) host.

*local\_file*. Optional file name to the local file. If not supplied, then the local file name defaults to be the same as the remote file name.

#### **Return strings**

Output shows the amount of data transferred and any error conditions.

#### **Error conditions**

Connection failures: data transfer connection malfunction.

Network failures: data transfer malfunction.

Allocation failures: no space on local machine for file.

Error codes may also be returned from HPSS. The most common error code is:

• "-5": an I/O error occurred.

#### See also

RFC-0959.

#### **Examples**

1. Transfer HPSS file /home/bob/prod1 to the user's local directory.

```
ftp> lfget /home/bob/prod1
... information is returned by the PFTP Daemon
ftp>
```

2. Transfer the HPSS file prod1 in the current working directory to local file testfile1.

```
ftp> lfget prod1 testfile1
... information is returned by the PFTP Daemon
ftp>
```

3. Transfer the HPSS file testfile into the "globally available" directory /home/bob renaming the file to testfile.

```
ftp> lfget prod1 /home/bob/testfile1 testfile
...information is returned by the PFTP Daemon
ftp>
```

4. Transfer 1 MB from offset 0 of HPSS file /home/bob/prod1 to offset 1048576 of local file testfile.

```
ftp> lfget -r 0 -l 1048576 -s 1048576 /home/bob/testfilel testfile ... information is returned by the PFTP Daemon ftp>
```

# 3.3.10. Multiple local file store - mlfput

# **Synopsis**

mlfput local\_files

## **Description**

The **mlfput** is a performance optimized Parallel FTP Client command used to transfer multiple "globally available" files into HPSS using the "parallel" protocols. *If* the one or more files are not available to the Mover machines (*not* "globally available"), the transfer will fail because the Movers will *not* be able to locate the desired files. The difference between **mlfput** and **mpput** is that the Movers involved in the transfer will not use the network to move the data, thus providing improved performance. The Mover machines *must* be correctly configured. The file: /var/hpss/etc/hpss\_mvr\_localfilepath.conf *must* exist on each "local file"-aware Mover machine and *must* contain entries specifying which directories are eligible for "local file" transport.

The **mlfput** command expands the files specified in the *local\_files* parameter at the local host and copies the indicated files to HPSS. The **mlfput** command functions just like the standard FTP **mput** command.

#### **Parameters**

*local\_files*. Identification of the files to transfer on the local machine.

# **Return strings**

Output shows the amount of data transferred and any error conditions.

#### **Error conditions**

Connection failures: data transfer connection malfunction.

Network failures: data transfer malfunction.

Allocation failures: no space on remote machine for file.

Error codes may also be returned from HPSS. The most common error codes are:

- "-5": an I/O error occurred.
- "-28": no space remaining in the associated storage class.

#### See also

RFC-0959.

#### **Examples**

1. Transfer all "globally available" files in the current directory to the user's HPSS home directory.

2. Transfer all "globally available" files which begin with "test" in directory /usr/bob to the user's HPSS home directory.

```
ftp> cd ~
... information is returned by the PFTP Daemon
ftp> mlfput /usr/bob/test*
... information is returned by the PFTP Daemon
ftp>
```

# 3.3.11. Multiple local file retrieval - mlfget

#### **Synopsis**

mlfget remote\_files

# **Description**

The **mlfget** is a performance optimized Parallel FTP Client command used to transfer an HPSS file into a "globally available" file using the "parallel" protocols. *If* the current working directory *or the specified directory* is not available to the Mover machines (*not* "globally available"), the transfer will fail because the Movers will *not* be able to locate the desired file. The difference between **mlfget** and **mpget** is that the Movers involved in the transfer will not use the network to move the data, thus providing improved performance. The Mover machines *must* be correctly configured. The file: /var/hpss/etc/hpss\_mvr\_localfilepath.conf *must* exist on each "local file"-aware Mover machine and *must* contain entries specifying which directories are eligible for "local file" transport.

The **mlfget** command expands the *remote\_files* parameter at the remote (HPSS) host and copies the indicated HPSS files to the current directory on the local host. The **mlfget** command functions just like the standard FTP **mget** command.

## **Parameters**

remote\_files. Identification of the files to transfer from the remote (HPSS) host.

#### **Return strings**

Output shows the amount of data transferred and any error conditions.

#### **Error conditions**

Connection failures: data transfer connection malfunction.

Network failures: data transfer malfunction.

Allocation failures: no space on remote machine for file.

Error codes may also be returned from HPSS. The most common error code is:

• "-5": an I/O error occurred.

#### See also

RFC-0959.

## **Examples**

1. Transfer all files in HPSS directory /home/bob to the "globally available" current working directory.

```
ftp> mlfget /home/bob/*
... information is returned by the PFTP Daemon
ftp>
```

2. Transfer all HPSS files which begin with "test" in directory /home/bob to the "globally available" current working directory.

```
ftp> mlfget /home/bob/test*
... information is returned by the PFTP Daemon
ftp>
```

# 3.3.12. Recursive commands - recursive

# **Synopsis**

**recursive** *mget*/*mput*/*mdelete dir\_name* 

# **Description**

The **recursive** command is used to recursively **mget**, **mput**, or **mdelete** a directory.

#### **Parameters**

*mget*/*mput*/*mdelete*. The recursive command to be performed. The commands perform similarly to regular **mget**, **mput**, and **mdelete**, except they perform recursively on all the files and subdirectories contained in the specified directory.

*dir\_name*. The directory on which to perform the recursive action. For **mget** or **mdelete**, this will be the remote directory to get or delete. For **mput**, this is the local directory to put.

#### **Return strings**

Output shows the amount of data transferred and any error conditions.

#### **Error conditions**

Connection failures: data transfer connection malfunction.

Network failures: data transfer malfunction.

Allocation failures: no space on remote machine for file.

Not Found failures: specified dir\_name does not exist or is not a directory

Error codes may also be returned from HPSS. The most common error code is:

• "-5": an I/O error occurred.

#### See also

RFC-3659. RFC-0959.

# **Examples**

- 1. Transfer local directory my\_dir1 and all of its contents to the user's HPSS home directory. ftp> recursive mput my\_dir1
- 2. Transfer directory my\_dir1 and all of its contents from the user's HPSS home directory to the local file system.

ftp> recursive mget my\_dir1

3. Delete directory my\_dir1 and all of its contents from the user's HPSS home directory. ftp> recursive mdelete my dir1

# 3.3.13. Specify transfer stripe width - setpwidth

#### **Synopsis**

setpwidth stripe\_width

## **Description**

The **setpwidth** command is used to specify the size of the client side stripe to the FTP client code.

# **Parameters**

*stripe\_width*. The width of the PFTP client-side stripe. The width can have a value of "1" through "16". The default width is "1". The stripe width from the PFTP client perspective is the number of client processes spawned to handle the data transfers. Stripe width from the server perspective is the number of volumes the file is striped across.

A general guideline would be to set *stripe\_width* to an even divisor of the number of volumes the file is striped across. For example, if the Class of Service for a file were set up for a 4-way stripe, suggested values for *stripe\_width* might be "2" or "4".

If the stripe width of the file is unknown, consult your HPSS administrator to determine the stripe width.

#### **Return strings**

Parallel stripe width set to [stripe width].

#### **Error conditions**

Bad width value [stripe width].

#### See also

RFC-0959.

# **Examples**

1. Set the stripe width to "4". ftp> setpwidth 4

# 3.3.14. Specify transfer block size - setpblocksize

# **Synopsis**

setpblocksize block\_size

# **Description**

The **setpblocksize** command is used to specify the block size to be used for parallel transfers. The *block\_size* may be specified using a decimal or magnitude representation string. See *Section 2.1.1*, "Allocating space for files - quote allo64" for use of this notation. The maximum block size is 16 MB.

#### **Parameters**

*block\_size*. The number of bytes to be transferred to each element of the stripe before data is sent to the next element. The current allowable transfer sizes range from one byte through 16 MB. The default block size is 256 KB.

A general guideline would be to set *block\_size* to the virtual volume block size. Consult your HPSS administrator to determine the virtual volume block size.

#### **Return strings**

Parallel block size set to [block size].

#### **Error conditions**

Bad block size value [block size].

#### See also

RFC-0959.

#### **Examples**

Set the transfer block size to 8 MB.

- 1. ftp> setpblocksize 8388608
- 2. ftp> setpblocksize 8MB

# 3.3.15. Multinode enable or disable - multinode

#### **Synopsis**

multinode

#### **Description**

The **multinode** command is used to enable or disable the ability to perform a parallel file transfer using multiple nodes. When multinode is enabled, the **pftp\_client** will process the multinode

configuration file. If the process cannot obtain a single node to perform the parallel transfer, then the transfer will occur using non-multinode parallel method.

#### **Parameters**

None.

# **Return strings**

```
Processing the multinode list, please wait....

Multinode is on.

Or

Multinode is off.
```

# **Error conditions**

Configuration file I/O problems: without nodes, files cannot be transferred using the multiple node capability.

# **Examples**

None.

# 3.3.16. Autoparallel enable or disable - autoparallel

## **Synopsis**

autoparallel

# **Description**

The **autoparallel** command is used to enable or disable the automatic mapping of non-parallel commands to parallel commands; that is, **get** maps to **pget**. In autoparallel mode (enabled), transfers involving files smaller than the "Auto Parallel Size" specification in the HPSS.conf will *not* be auto-mapped.

#### **Parameters**

None.

## **Return string**

```
Automatic Substitution of Parallel Commands Disabled

Daemon supports Parallel Features - Auto-Parallel Substitution Enabled
```

#### **Error conditions**

?Invalid command

#### See also

HPSS.conf(7)

## **Examples**

ftp> autop
 Automatic Substitution of Parallel Commands Disabled
 or

Daemon supports Parallel Features - Auto-Parallel Substitution Enabled

# 3.3.17. Get current protocol mode - getprot

# **Synopsis**

getprot

# **Description**

Display the current parallel protocol mode.

#### **Parameters**

None.

# **Return strings**

```
Current Parallel Protocol is PDATA and MOVER to MOVER
Current Parallel Protocol is PDATA ONLY
Current Parallel Protocol is PDATA PUSH
```

#### **Error conditions**

?Invalid command ==> Older Client?

#### See also

None.

## **Examples**

1. ftp> getprot

```
Current Parallel Protocol is PDATA and MOVER to MOVER
Current Parallel Protocol is PDATA ONLY
Current Parallel Protocol is PDATA PUSH
```

# 3.3.18. Get tuning parameters - gettun

# **Synopsis**

gettun hostname/IP Addr

## **Description**

Display the (transfer) parameters between the client and other hosts (default is the PFTP Daemon host).

# **Parameters**

None.

## **Return strings**

See example below.

#### **Error conditions**

Warning Preceding without HPSS.conf (-2) (This may be observed at login time.)

HPSS.conf parsing errors.

#### See also

None.

## **Examples**

```
1. ftp> gettun
  Effective Tuning parameters from saux22 to sair031
       Using PDATA_AND_MOVER protocol
       Using 4.1 Protocol
       Parallel Transfer Size = 2147483647
       Transfer Buffer Size = 16777216
       Parallel Block Size = 262144
       Parallel Network Width = 1
       No Interfaces Found (ret_code = -2)
       Using Default Interface for 1 stripes(s)
       Multinode is disabled
  or
       Multinode Enabled:
       Processing the multinode list, please wait .....
       Using 1 remote node(s) from the following:
       Control Interface ==> Data Interface:
       water ==> water
       Using Network Options
       Using "Default" destination characteristics
       PdataSockBufSize = 1048576 based on user input
       recv_socksize = send_socksize = 1048576 based on
                                        PdataSockBufSize
       Writesize = 524288
  or
       recv_socksize = 262144 based on Network Options
       send_socksize = 262144 based on Network Options
       PdataSockBufSize = 262144 based on send_socksize
       RFC1323 is turned on
       TCPNoDelay is turned on
```

The use of "Parallel Pipes" should be discouraged; however, you may observe either of the following two scenarios:

PipeFileSize TOO Large reset to 2147483647
Pipe Files NOT supported on this machine- Open Failed 2
or
Pipe Files are supported on this machine
Pipe File = /copylvol/.pftp\_pipes26404
Pipe File Size = 1073741824

# 3.3.19. Set the PDATA\_ONLY protocol - pdata

# **Synopsis**

pdata

# **Description**

Explicitly request the PDATA\_ONLY protocol.

#### **Parameters**

None.

## **Return strings**

```
**** NOTE: Protocol set to PDATA_ONLY **** (at logon time)
215 Parallel protocol is PDATA ONLY
```

#### **Error conditions**

?Invalid command ==> Older Client?

#### See also

None.

# **Examples**

1. Set protocol to PDATA\_ONLY (failure).

```
ftp> pdata
Server does NOT support command ==> Older Server?
?Invalid command ==> Older Client?
ftp>
```

# 3.3.20. Set the PDATA\_PUSH protocol - pdatapush

## **Synopsis**

pdatapush

# **Description**

Explicitly request the PDATA\_PUSH protocol.

#### **Parameters**

None.

#### **Return strings**

```
**** NOTE: Protocol set to PDATA_PUSH **** (at logon time) 215 Parallel protocol is PDATA_PUSH
```

#### **Error conditions**

```
?Invalid command ==> Older Client?
```

## See also

None.

# **Examples**

1. Set protocol to PDATA\_PUSH (failure).

```
ftp> pdatapush
Server does NOT support command ==> Older Server?
?Invalid command ==> Older Client?
ftp>
```

# 3.3.21. Set the PDATA\_AND\_MOVER protocol - pmover

# **Synopsis**

pmover

# **Description**

Explicitly specify parallel transfers to use the PDATA\_AND\_MOVER protocol regardless of what is specified in the HPSS.conf file.

#### **Parameters**

None.

#### **Return strings**

```
215 Parallel protocol is PDATA_AND_MOVER
```

#### **Error conditions**

```
Server does NOT support command ==> Older Server?
?Invalid command ==> Older Client?
```

#### See also

HPSS.conf(7)

## **Examples**

1. Set PDATA\_AND\_MOVER protocol.

```
ftp> pmover
215 Parallel protocol is PDATA_AND_MOVER
ftp>
```

# 3.3.22. Set the socket buffer size - setsock

#### **Synopsis**

setsock SizeString

# **Description**

Set the desired socket buffer size. This is useful when no HPSS.conf file exists or the client/Mover combination is *not* in the HPSS.conf file. When entered without a SizeString, the command returns the socket buffer size in effect.

# **Parameters**

*SizeString*. For example, "1MB".

#### **Return strings**

Socket Buffer Size = 1048576.

#### **Error conditions**

PdataSockBufSize reset equal or below sb\_max (1048576)

#### See also

None.

# **Example**

1. Set socket buffer size (above system maximum).

```
ftp> setsock 4mb
PdataSockBufSize reset equal or below sb_max (1048576)
ftp>
```

2. Set socket buffer size.

```
ftp> setsock 512kb
ftp>
```

3. Set socket buffer size (no argument).

```
ftp> setsock
Socket Buffer Size = 524288.
ftp>
```

# 3.3.23. Set the transfer buffer size - setxfer

# **Synopsis**

setxferbufsize SizeString

## **Description**

Set the desired transfer buffer sizes. This is useful when no HPSS.conf file exists or the client/daemon combination is *not* in the HPSS.conf file. When entered without a SizeString, the command returns the transfer buffer size in effect.

#### **Parameters**

SizeString. For example, "4MB".

#### **Return strings**

PdataBufferSize = 4194304

#### **Error conditions**

?Invalid command ==> Old Client?

## See also

None.

# **Examples**

1. Set transfer buffer size (the maximum value is 32 MB).

```
ftp> setxfer 40MB
```

ftp>

2. Display effective transfer buffer size (no argument).

```
ftp> setxfer
PdataBufferSize = 33554432.
ftp>
```

# Appendix A. Glossary of terms and acronyms

ACL Access Control List

ACSLS Automated Cartridge System Library Software (Oracle StorageTek)

**ADIC** Advanced Digital Information Corporation

**accounting** The process of tracking system usage per user, possibly for the purposes of charging

for that usage. Also, a log record type used to log accounting information.

**ACI** AML Client Interface

**AIX** Advanced Interactive Executive. An operating system provided on many IBM

machines.

**alarm** A log record type used to report situations that require administrator investigation or

intervention.

**AML** Automated Media Library. A tape robot.

**AMS** Archive Management Unit

ANSI American National Standards Institute

**API** Application Program Interface

**archive** One or more interconnected storage systems of the same architecture.

**ASLR** Address Space Layout Randomization

**attribute** When referring to a managed object, an attribute is one discrete piece of information,

or set of related information, within that object.

**attribute** When referring to a managed object, an attribute change is the modification of an

**change** object attribute. This event may result in a notification being sent to SSM, if SSM is

currently registered for that attribute.

audit An operation that produces lists of HPSS log messages whose record type is

(security) SECURITY. A security audit is used to provide a trail of security-relevant activity in

HPSS.

**AV** Account Validation

**bar code** An array of rectangular bars and spaces in a predetermined pattern which represent

alphanumeric information in a machine-readable format (such as a UPC symbol).

**BFS** HPSS Bitfile Service

**bitfile** A file stored in HPSS, represented as a logical string of bits unrestricted in size or

internal structure. HPSS imposes a size limitation in 8-bit bytes based upon the maximum size in bytes that can be represented by a 64-bit unsigned integer.

**bitfile** An internal metadata structure, not normally visible, used by the Core Server to map

**segment** contiguous pieces of a bitfile to underlying storage.

**Bitfile** Portion of the HPSS Core Server that provides a logical abstraction of bitfiles to its

Service clients.

**BBTM** Blocks Between Tape Marks. The number of data blocks that are written to a tape

virtual volume before a tape mark is required on the physical media.

**CAP** Cartridge Access Port

cartridge A physical media container, such as a tape reel or cassette, capable of being mounted

on and dismounted from a drive. A fixed disk is technically considered to be a cartridge because it meets this definition and can be logically mounted and

dismounted.

**class** A type definition in Java. It defines a template on which objects with similar

characteristics can be built, and includes variables and methods specific to the class.

Class of Service

A set of storage system characteristics used to group bitfiles with similar logical characteristics and performance requirements together. A Class of Service is

supported by an underlying hierarchy of storage classes.

**cluster** The unit of storage space allocation on HPSS disks. The smallest amount of disk

space that can be allocated from a virtual volume is a cluster. The size of the cluster on any given disk volume is determined by the size of the smallest storage segment

that will be allocated on the volume, and other factors.

configuration The process of initializing or modifying various parameters affecting the behavior of

an HPSS server or infrastructure service.

**COS** Class of Service

**Core Server** An HPSS server which manages the namespace and storage for an HPSS system.

The Core Server manages the Name Space in which files are defined, the attributes of the files, and the storage media on which the files are stored. The Core Server is the central server of an HPSS system. Each storage subsystem uses exactly one Core

Server.

**CRC** Cyclic Redundancy Check

**CS** Core Server

**daemon** A UNIX program that runs continuously in the background.

**DAS** Distributed AML Server

**DB2** A relational database system, a product of IBM Corporation, used by HPSS to store

and manage HPSS system metadata.

**DCE** Distributed Computing Environment

**debug** A log record type used to report internal events that can be helpful in troubleshooting

the system.

**delog** The process of extracting, formatting, and outputting HPSS central log records. This

process is obsolete in 7.4 and later versions of HPSS. HPSS logs are now recorded as

plain text.

**deregistration** The process of disabling notification to SSM for a particular attribute change.

**descriptive** A human-readable name for an HPSS server.

name

**device** A physical piece of hardware, usually associated with a drive, that is capable of

reading or writing data.

**directory** An HPSS object that can contain files, symbolic links, hard links, and other

directories.

dismount An operation in which a cartridge is either physically or logically removed from

> a device, rendering it unreadable and unwritable. In the case of tape cartridges, a dismount operation is a physical operation. In the case of a fixed disk unit, a dismount

is a logical operation.

Domain Name Service DNS DOE Department of Energy

**DPF Database Partitioning Feature** 

drive A physical piece of hardware capable of reading or writing mounted cartridges. The

terms device and drive are often used interchangeably.

Exabyte  $(2^{60})$  $\mathbf{EB}$ End of File **EOF EOM** End of Media

**ERA Extended Registry Attribute ESCON Enterprise System Connection** 

A log record type used to report informational messages (for example, subsystem event

starting or subsystem terminating).

export An operation in which a cartridge and its associated storage space are removed from

the HPSS system Physical Volume Library. It may or may not include an eject, which

is the removal of the cartridge from its Physical Volume Repository.

FC SAN Fiber Channel Storage Area Network

**FIFO** First in first out

file An object than can be written to, read from, or both, with attributes including access

permissions and type, as defined by POSIX (P1003.1-1990). HPSS supports only

regular files.

file family An attribute of an HPSS file that is used to group a set of files on a common set of

tape virtual volumes.

fileset A collection of related files that are organized into a single easily managed unit. A

fileset is a disjoint directory tree that can be mounted in some other directory tree to

make it accessible to users.

fileset ID A 64-bit number that uniquely identifies a fileset.

fileset name A name that uniquely identifies a fileset.

A 32-bit number that uniquely identifies an aggregate. file system

ID

**FTP** File Transfer Protocol

**Gatekeeper** An HPSS server that provides two main services: the ability to schedule the use of

HPSS resources referred to as the Gatekeeping Service, and the ability to validate user

accounts referred to as the Account Validation Service.

**Gatekeeping** A registered interface in the Gatekeeper that provides a site the mechanism to create

Service local policy on how to throttle or deny create, open and stage requests and which of

these request types to monitor.

**Gatekeeping** The APIs of the gatekeeping site policy code.

Site Interface

**Gatekeeping** The gatekeeping shared library code written by the site to monitor and throttle create,

**Site Policy** open, and/or stage requests.

**GB** Gigabyte  $(2^{30})$ 

**GECOS** The comment field in a UNIX password entry that can contain general information

about a user, such as office or phone number.

**GID** Group Identifier

**GK** Gatekeeper

GSS Generic Security Service
GUI Graphical User Interface

**HA** High Availability

**HACMP** High Availability Clustered Multi-Processing - A software package used to

implement high availability systems.

**HADR** DB2 High Availability Disaster Recovery

halt A forced shutdown of an HPSS server.

**HBA** Host Bus Adapter

HDM Shorthand for HPSS/DMAP.HDP High Density Passthrough

**hierarchy** See *storage hierarchy*.

**HPSS** High Performance Storage System

**HPSS-only** An HPSS fileset that is not linked to an external file system (such as XFS).

fileset

**HTP** HPSS Test Plan

**IBM** International Business Machines Corporation

**ID** Identifier

**IDE** Integrated Drive Electronics

**IEEE** Institute of Electrical and Electronics Engineers

**import** An operation in which a cartridge and its associated storage space are made available

to the HPSS system. An import requires that the cartridge has been physically introduced into a Physical Volume Repository (injected). Importing the cartridge

makes it known to the Physical Volume Library.

I/O Input/Output

**IOD/IOR** I/O Descriptor/I/O Reply. Structures used to send control information about data

movement requests in HPSS and about the success or failure of the requests.

**IP** Internet Protocol

**IRIX** SGI's implementation of UNIX

**JRE** Java Runtime Environment

**junction** A mount point for an HPSS fileset.

**KB** Kilobyte  $(2^{10})$ 

KDC Key Distribution CenterLAN Local Area Network

**LANL** Los Alamos National Laboratory

**latency** For tape media, the average time in seconds between the start of a read or write

request and the time when the drive actually begins reading or writing the tape.

LBP Logical Block Protection

**LDAP** Lightweight Directory Access Protocol

**LFT** Local File Transfer

**LLNL** Lawrence Livermore National Laboratory

LMU Library Management Unit

**Location** An HPSS server that is used to help clients locate the appropriate Core Server or other

**Server** HPSS server to use for a particular request.

**log record** A message generated by an HPSS application and handled and recorded by the HPSS

logging subsystem.

**log record** A log record may be of type alarm, event, info, debug, request, security, trace, or

**type** accounting.

**logging** An HPSS infrastructure service consisting of the logging subsystem and one or more

service logging policies. A default logging policy can be specified, which will apply to all

servers, or server-specific logging policies may be defined.

**LS** Location Server

**LSM** Library Storage Module

LTO Linear Tape-Open. A half-inch open tape technology developed by IBM, HP, and

Seagate.

**LUN** Logical Unit Number

**LVM** Logical Volume Manager

MAC Mandatory Access Control

**managed** A programming data structure that represents an HPSS system resource. The resource

can be monitored and controlled by operations on the managed object. Managed

objects in HPSS are used to represent servers, drives, storage media, jobs, and other

resources.

**MB** Megabyte  $(2^{20})$ 

object

MBS Media Block Size

metadata Control information about the data stored under HPSS, such as location, access times,

permissions, and storage policies. Most HPSS metadata is stored in a DB2 relational

database.

**method** A Java function or subroutine.

migrate To copy file data from a level in the file's hierarchy onto the next lower level in the

hierarchy.

**Migration**/ An HPSS server responsible for supervising the placement of data in the storage

Purge Server hierarchies based upon site-defined migration and purge policies.

MM Metadata Manager. A software library that provides a programming API to interface

HPSS servers with the DB2 programming environment.

**mount** An operation in which a cartridge is either physically or logically made readable/

writable on a drive. In the case of tape cartridges, a mount operation is a physical

operation. In the case of a fixed disk unit, a mount is a logical operation.

**mount point** A place where a fileset is mounted in the XFS and HPSS namespaces.

**Mover** An HPSS server that provides control of storage devices and data transfers within

HPSS.

MPS Migration/Purge Server

MVR Mover

NASA National Aeronautics and Space Administration

**Name** The portion of the Core Server that provides a mapping between names and machine

**Service** oriented identifiers. In addition, the Name Service performs access verification and

provides the Portable Operating System Interface (POSIX).

**name space** The set of name-object pairs managed by the HPSS Core Server.

**NERSC** National Energy Research Supercomputer Center

NIS Network Information Service
NLS National Language Support

**notification** A notice from one server to another about a noteworthy occurrence. HPSS

notifications include notices sent from other servers to SSM of changes in managed object attributes, changes in tape mount information, and log messages of type alarm

or event.

**NS** HPSS Name Service

**NSL** National Storage Laboratory

**object** See managed object.

**ORNL** Oak Ridge National Laboratory

**OS** Operating System

OS/2 The operating system (multi-tasking, single user) used on the AMU controller PC.

**PB** Petabyte (2<sup>50</sup>)

**PFTP** Parallel File Transfer Protocol

**PFTPD** PFTP Daemon

physical An HPSS object managed jointly by the Core Server and the Physical Volume Library

**volume** that represents the portion of a virtual volume. A virtual volume may be composed of one or more physical volumes, but a physical volume may contain data from no more

than one virtual volume.

**Physical** An HPSS server that manages mounts and dismounts of HPSS physical volumes.

Volume Library

**Physical** An HPSS server that manages the robotic agent responsible for mounting and

**Volume** dismounting cartridges or interfaces with the human agent responsible for mounting

**Repository** and dismounting cartridges.

**PIO** Parallel I/O

**PIOFS** Parallel I/O File System

**POSIX** Portable Operating System Interface (for computer environments).

**purge** Deletion of file data from a level in the file's hierarchy after the data has been

duplicated at lower levels in the hierarchy and is no longer needed at the deletion

level.

**purge lock** A lock applied to a bitfile which prohibits the bitfile from being purged.

**PV** Physical Volume

PVL Physical Volume Library
PVM Physical Volume Manager
PVR Physical Volume Repository

RAID Redundant Array of Independent DisksRAIT Redundant Array of Independent Tapes

RAM Random Access Memory
RAO Recommended Access Order

**reclaim** The act of making previously written but now empty tape virtual volumes available

for reuse. Reclaimed tape virtual volumes are assigned a new Virtual Volume ID, but retain the rest of their previous characteristics. Reclaim is also the name of the utility

program that performs this task.

**registration** The process by which SSM requests notification of changes to specified attributes of a

managed object.

reinitializationAn HPSS SSM administrative operation that directs an HPSS server to reread its

latest configuration information, and to change its operating parameters to match that

configuration, without going through a server shutdown and restart.

**repack** The act of moving data from a virtual volume onto another virtual volume with the

same characteristics with the intention of removing all data from the source virtual volume. Repack is also the name of the utility program that performs this task.

**request** A log record type used to report some action being performed by an HPSS server on

behalf of a client.

**RISC** Reduced Instruction Set Computer/Cycles

**RPC** Remote Procedure Call

**SCSI** Small Computer Systems Interface

**security** A log record type used to report security-related events (for example, authorization

failures).

**SGI** Silicon Graphics

**shelf tape** A cartridge which has been physically removed from a tape library but whose file

metadata still resides in HPSS.

**shutdown** An HPSS SSM administrative operation that causes a server to stop its execution

gracefully.

**sink** The set of destinations to which data is sent during a data transfer, such as disk

devices, memory buffers, or network addresses.

**SM** System Manager

SMC SCSI Medium Changer
SME Subject Matter Expert

**SNL** Sandia National Laboratories

**SOID** Storage Object ID. An internal HPSS storage object identifier that uniquely identifies

a storage resource. The SOID contains an unique identifier for the object, and an

unique identifier for the server that manages the object.

**source** The set of origins from which data is received during a data transfer, such as disk

devices, memory buffers, or network addresses.

SP Scalable Processor

SS HPSS Storage Service

SSD Solid State Drive

**SSH** Secure Shell

**SSI** Storage Server Interface

SSM Storage System Management

**SSM session** The environment in which an SSM user interacts with the SSM System Manager to

monitor and control HPSS. This environment may be the graphical user interface provided by the **hpssgui** program, or the command line user interface provided by the

hpssadm program.

**SSMSM** Storage System Management System Manager

stage To copy file data from a level in the file's hierarchy onto the top level in the

hierarchy.

**start-up** An HPSS SSM administrative operation that causes a server to begin execution.

**info** A log record type used to report file staging and other kinds of information.

STK Storage Technology Corporation (Oracle StorageTek)

storage class An HPSS object used to group storage media together to provide storage for HPSS

data with specific characteristics. The characteristics are both physical and logical.

**storage** An ordered collection of storage classes. The hierarchy consists of a fixed number of storage levels numbered from level 1 to the number of levels in the hierarchy,

with the maximum level being limited to 5 by HPSS. Each level is associated with a specific storage class. Migration and stage commands result in data being copied between different storage levels in the hierarchy. Each Class of Service has an

associated hierarchy.

**storage level** The relative position of a single storage class in a storage hierarchy. For example, if a

storage class is at the top of a hierarchy, the storage level is 1.

**storage map** An HPSS object managed by the Core Server to keep track of allocated storage space.

**storage** An HPSS object managed by the Core Server to provide abstract storage for a bitfile

**segment** or parts of a bitfile.

**Storage** The portion of the Core Server which provides control over a hierarchy of virtual and

**Service** physical storage resources.

**storage** A portion of the HPSS namespace that is managed by an independent Core Server and

**subsystem** (optionally) Migration/Purge Server.

**Storage** An HPSS component that provides monitoring and control of HPSS via a windowed

**System** operator interface or command line interface.

**Management** 

**stripe length** The number of bytes that must be written to span all the physical storage media

(physical volumes) that are grouped together to form the logical storage media

(virtual volume). The stripe length equals the virtual volume block size multiplied by the number of physical volumes in the stripe group (that is, stripe width).

**stripe width** The number of physical volumes grouped together to represent a virtual volume.

System The Storage System Management (SSM) server. It communicates with all other HPSS components requiring monitoring or control. It also communicates with the SSM

graphical user interface (**hpssgui**) and command line interface (**hpssadm**).

**TB** Terabyte  $(2^{40})$ 

TCP/IP Transmission Control Protocol/Internet Protocol

**TDS** Tivoli Directory Server

TI-RPC Transport-Independent-Remote Procedure Call

trace A log record type used to record procedure entry/exit events during HPSS server

software operation.

**transaction** A programming construct that enables multiple data operations to possess the

following properties:

• All operations commit or abort/roll-back together such that they form a single unit of work.

- All data modified as part of the same transaction are guaranteed to maintain a consistent state whether the transaction is aborted or committed.
- Data modified from one transaction are isolated from other transactions until the transaction is either committed or aborted.
- Once the transaction commits, all changes to data are guaranteed to be permanent.

**TSA/MP** Tivoli System Automation for Multiplatforms

TSM Tivoli Storage Manager
UDA User-defined Attribute
UDP User Datagram Protocol

**UID** User Identifier

UPC Universal Product CodeUUID Universal Unique Identifier

**VPN** Virtual Private Network

virtual An HPSS object managed by the Core Server that is used to represent logical media.

A virtual volume is made up of a group of physical storage media (a stripe group of

physical volumes).

virtual The size of the block of data bytes that is written to each physical volume of a striped volume block virtual volume before switching to the next physical volume.

size

VV Virtual Volume

**XDSM** The Open Group's Data Storage Management standard. It defines APIs that use

events to notify Data Management applications about operations on files.

**XFS** A file system created by SGI available as open source for the Linux operating system.

**XML** Extensible Markup Language

# Appendix C. Developer acknowledgments

HPSS is a product of a government-industry collaboration. The project approach is based on the premise that no single company, government laboratory, or research organization has the ability to confront all of the system-level issues that must be resolved for significant advancement in high-performance storage system technology.

HPSS development was performed jointly by IBM Worldwide Government Industry, Lawrence Berkeley National Laboratory, Lawrence Livermore National Laboratory, Los Alamos National Laboratory, NASA Langley Research Center, Oak Ridge National Laboratory, and Sandia National Laboratories.

We would like to acknowledge Argonne National Laboratory, the National Center for Atmospheric Research, and Pacific Northwest Laboratory for their help with initial requirements reviews.

We also wish to acknowledge Cornell Information Technologies of Cornell University for providing assistance with naming service and transaction management evaluations and for joint developments of the Name Service.

In addition, we wish to acknowledge the many discussions, design ideas, implementation and operation experiences we have shared with colleagues at the National Storage Laboratory, the IEEE Mass Storage Systems and Technology Technical Committee, the IEEE Storage System Standards Working Group, and the storage community at large.

We also wish to acknowledge the Cornell Theory Center and the Maui High Performance Computer Center for providing a test bed for the initial HPSS release.

We also wish to acknowledge Gleicher Enterprises, LLC for the development of the HSI, HTAR and Transfer Agent client applications.

Finally, we wish to acknowledge CEA-DAM (**Commissariat à l'Énergie Atomique - Centre d'Études de Bruyères-le-Châtel**) for providing assistance with development of NFS V3 protocol support.
